What is a closure in programming?

A closure is a function that captures the lexical scope in which it is declared. This means that it can access variables and parameters from its containing function even after that function has finished executing. Closures are commonly used to create private variables and to implement callbacks and asynchronous code.

Evaluation

The answer provides a clear and concise explanation of what a closure is in programming. It correctly identifies its ability to capture and access variables from its lexical scope. The explanation also highlights common use cases for closures, such as creating private variables and implementing callbacks.

0.95

What is the difference between '==' and '===' in JavaScript?

'==' is a loose equality operator in JavaScript, which means it compares two values after converting them to a common type. On the other hand, '===' is a strict equality operator, which means it compares both the value and the type of the operands without any type conversion. For example, 1 == '1' would be true, but 1 === '1' would be false.

Evaluation

The answer provides a clear and accurate distinction between the '==' and '===' operators in JavaScript. It correctly explains that '==' performs type conversion before comparison, while '===' does not. The example helps illustrate the difference in behavior between the two operators.

What is recursion and when would you use it?

Recursion is a programming technique where a function calls itself in order to solve smaller instances of the same problem. Recursion is often used when a problem can be broken down into smaller, similar subproblems, and when it is more concise and readable than an iterative solution.

Evaluation

The answer provides a clear definition of recursion in programming and identifies its common use cases. It correctly explains that recursion is used to solve problems that can be broken down into smaller subproblems. The answer also notes that recursion can lead to more concise and readable code in certain situations.
